3	Indices and tables	13
	Python Module Index	15

This package provides easy APIs to use [Wikidata](#) for Python.

```
>>> from wikidata.client import Client
>>> client = Client()
>>> entity = client.get('Q20145', load=True)
>>> entity
<wikidata.entity.Entity Q20145 'IU'>
>>> entity.description
m'South Korean singer and actress'
>>> image_prop = client.get('P18')
>>> image = entity[image_prop]
>>> image
<wikidata.commonsmedia.File 'File:KBS "The Producers" press conference, 11 May 2015
→10.jpg'>
>>> image.image_resolution
(820, 1122)
>>> image.image_url
'https://upload.wikimedia.org/wikipedia/commons/6/60/KBS_%22The_Producers%22_press_
→conference%2C_11_May_2015_10.jpg'
```

CHAPTER 1

wikidata — Wikidata client library

wikidata.cache — Caching policies

Changed in version 0.5.0.

`wikidata.cache.CacheKey(x)`

The type of keys to look up cached values. Alias of `str`.

`class wikidata.cache.CachePolicy`

Interface for caching policies.

`get(key: <function NewType.<locals>.new_type at 0x7f343b6e1c80>) → typing.Union[<function NewType.<locals>.new_type at 0x7f343b6e1d08>, NoneType]`
Look up a cached value by its key.

Parameters `key (CacheKey)` – The key string to look up a cached value.

Returns The cached value if it exists. `None` if there's no such `key`.

Return type `Optional[CacheValue]`

`set(key: <function NewType.<locals>.new_type at 0x7f343b6e1c80>, value: typing.Union[<function NewType.<locals>.new_type at 0x7f343b6e1d08>, NoneType]) → None`
Create or update a cache.

Parameters

- `key (CacheKey)` – A key string to create or update.
- `value (Optional[CacheValue])` – A value to cache. `None` to remove cache.

`wikidata.cache.CacheValue(x)`

The type of cached values.

`class wikidata.cache.MemoryCachePolicy(max_size: int = 128) → None`
LRU (least recently used) cache in memory.

Parameters `max_size (int)` – The maximum number of values to cache. 128 by default.

```
class wikidata.cache.NullCachePolicy
    No-op cache policy.
```

```
class wikidata.cache.ProxyCachePolicy(cache_object, timeout: int, property_timeout: typing.Union[int, NoneType] = None, namespace: str = 'wd_') → None
```

This proxy policy is a proxy or an adaptor to another cache object. Cache objects can be anything if they satisfy the following interface:

```
def get(key: str) -> Optional[bytes]: pass
def set(key: str, value: bytes, timeout: int=0) -> None: pass
def delete(key: str) -> None: pass
```

(The above methods omit `self` parameters.) It's compatible with de facto interface for caching libraries in Python (e.g. `python-memcached`, `werkzeug.contrib.cache`).

Parameters

- **cache_object** – The cache object to adapt. Read the above explanation.
- **timeout** (`int`) – Lifespan of every cache in seconds. 0 means no expiration.
- **property_timeout** (`int`) – Lifespan of caches for properties (in seconds). Since properties don't change frequently or their changes usually don't make important effect, longer lifespan of properties' cache can be useful. 0 means no expiration. Set to the same as `timeout` by default.
- **namespace** (`str`) – The common prefix attached to every cache key. '`wd_`' by default.

wikidata.client — Client session

```
wikidata.client.WIKIDATA_BASE_URL = 'https://www.wikidata.org/'
```

(`str`) The default `base_url` of `Client` constructor.

Changed in version 0.3.0: As the meaning of `Client` constructor's `base_url` parameter, it now became to `https://www.wikidata.org/` from `https://www.wikidata.org/wiki/` (which contained the trailing path `wiki/`).

```
class wikidata.client.Client
```

Wikidata client session.

Parameters

- **base_url** (`str`) – The base url of the Wikidata. `WIKIDATA_BASE_URL` is used by default.
- **opener** (`urllib.request.OpenerDirector`) – The opener for `urllib.request`. If omitted or `None` the default opener is used.
- **entity_type_guess** (`bool`) – Whether to guess `type` of `Entity` from its `id` for less HTTP requests. `True` by default.
- **cache_policy** – A caching policy for API calls. No cache (`NullCachePolicy`) by default.

New in version 0.5.0: The `cache_policy` option.

Changed in version 0.3.0: The meaning of `base_url` parameter changed. It originally meant `https://www.wikidata.org/wiki/` which contained the trailing path `wiki/`, but now it means only `https://www.wikidata.org/`.

New in version 0.2.0: The `entity_type_guess` option.

cache_policy = <`wikidata.cache.NullCachePolicy` object>
 (CachePolicy) A caching policy for API calls.

New in version 0.5.0.

datavalue_decoder = `None`
 (Union[`Decoder`, Callable[[`Client`, str, Mapping[str, object]], object]]) The function to decode the given datavalue. It's typically an instance of `Decoder` or its subclass.

decode_datavalue (`datatype: str, datavalue: typing.Mapping[str, object]`) → object
 Decode the given datavalue using the configured `datavalue_decoder`.

New in version 0.3.0.

entity_type_guess = `True`
 (bool) Whether to guess `type` of `Entity` from its `id` for less HTTP requests.

New in version 0.2.0.

get (`entity_id: <function NewType.<locals>.new_type at 0x7f343b5d68c8>, load: bool = False`) → `wikidata.entity.Entity`
 Get a Wikidata entity by its EntityId.

Parameters

- **entity_id** – The id of the `Entity` to find.
- **load** (bool) – Eager loading on True. Lazy loading (False) by default.

Returns The found entity.

Return type `Entity`

New in version 0.3.0: The `load` option.

guess_entity_type (`entity_id: <function NewType.<locals>.new_type at 0x7f343b5d68c8>`) → `typing.Union[wikidata.entity.EntityType, NoneType]`
 Guess `EntityType` from the given EntityId. It could return `None` when it fails to guess.

Note: It always fails to guess when `entity_type_guess` is configued to False.

Returns The guessed EntityId, or `None` if it fails to guess.

Return type `Optional[EntityType]`

New in version 0.2.0.

wikidata.commonsmedia — Wikimedia Commons

New in version 0.3.0.

class `wikidata.commonsmedia.File` (`client: wikidata.client.Client, title: str`) → `None`
 Represent a file on Wikimedia Commons.

image_mimetype
 (Optional[str]) The MIME type of the image. It may be `None` if it's not an image.

```
image_resolution
    (Optional[Tuple[int, int]]) The (width, height) pair of the image. It may be None if it's not an
    image.

image_size
    (Optional[int]) The size of the image in bytes. It may be None if it's not an image.

image_url
    (Optional[str]) The image url. It may be None if it's not an image.

page_url
    (str) The canonical url of the page.

exception wikidata.commonsmedia.FileError
    Exception raised when something goes wrong with File.
```

wikidata.datavalue — Interpreting datavalues

This module provides the decoder interface for customizing how datavalues are decoded, and the default *Decoder* implementation.

Technically the interface is just a callable so that its implementation doesn't necessarily have to be an instance of *Decoder* or its subclass, but only need to satify:

```
typing.Callable[[wikidata.client.Client, str, typing.Mapping[str, object]], object]
```

New in version 0.3.0.

```
exception wikidata.datavalue.DatavalueError(*args, **kwargs)
    Exception raised during decoding datavalues. It subclasses ValueError as well.

datavalue
    The datavalue which caused the decoding error.
```

```
class wikidata.datavalue.Decoder
    Decode the given datavalue to a value of the appropriate Python type. For extensibility it uses visitor
    pattern and is intended to be subclassed. To customize decoding of datavalues subclass it and configure
    datavalue_decoder option of Client to the customized decoder.
```

It automatically invokes an appropriate visitor method using a simple rule of name: {datatype}__{datavalue[type]}. For example, if the following call to a decoder was made:

```
decoder(client, 'mydatatype', {'type': 'mytype', 'value': '...'})
```

it's delegated to the following visitor method call:

```
decoder.mydatatype__mytype(client, {'type': 'mytype', 'value': '...'})
```

If a decoder failed to find a visitor method matched to {datatype}__{datavalue[type]} pattern it secondly try to find a general version of visitor method: {datavalue[type]} which lacks double underscores. For example, for the following call:

```
decoder(client, 'mydatatype', {'type': 'mytype', 'value': '...'})
```

It firstly try to find the following visitor method:

```
decoder.mydatatype__mytype
```

but if there's no such method it secondly try to find the following general visitor method:

```
decoder.mytype
```

This twice-try dispatch is useful when to make a visitor method to be matched regardless of datatype.

If its `datavalue[type]` contains hyphens they're replaced by underscores. For example:

```
decoder(client, 'string',
        {'type': 'wikibase-entityid', 'value': 'a text value'})
```

the above call is delegated to the following visitor method call:

```
decoder.string__wikibase_entityid(
    #      Note that the ^ underscore
    client,
    {'type': 'wikibase-entityid', 'value': 'a text value'}
)
```

wikidata.entity — Wikidata entities

class `wikidata.entity.Entity`

Wikidata entity. Can be an item or a property. Its attributes can be lazily loaded.

To get an entity use `Client.get()` method instead of the constructor of `Entity`.

Note: Although it implements `Mapping[EntityId, object]`, it actually is multidict. See also `getlist()` method.

Changed in version 0.2.0: Implemented `Mapping[EntityId, object]` protocol for easy access of statement values.

Changed in version 0.2.0: Implemented `Hashable` protocol and `==/=` operators for equality test.

getlist (`key: wikidata.entity.Entity`) → `typing.Sequence[object]`

Return all values associated to the given `key` property in sequence.

Parameters `key (Entity)` – The property entity.

Returns A sequence of all values associated to the given `key` property. It can be empty if nothing is associated to the property.

Return type `Sequence[object]`

lists () → `typing.Sequence[typing.Tuple[typing.Entity, typing.Sequence[object]]]`

Similar to `items()` except the returning pairs have each list of values instead of each single value.

Returns The pairs of (`key, values`) where `values` is a sequence.

Return type `Sequence[Tuple[Entity, Sequence[object]]]`

type

(`EntityType`) The type of entity, `item` or `property`.

New in version 0.2.0.

`wikidata.entity.EntityId(x)`

The identifier of each `Entity`. Alias of `str`.

class `wikidata.entity.EntityType`

The enumerated type which consists of two possible values:

- *item*
- *property*

New in version 0.2.0.

item = ‘item’

(*EntityType*) Items are *Entity* objects that are typically represented by Wikipage (at least in some Wikipedia languages). They can be viewed as “the thing that a Wikipage is about,” which could be an individual thing (the person [Albert Einstein](#)), a general class of things (the class of all [Physicists](#)), and any other concept that is the subject of some Wikipedia page (including things like [History of Berlin](#)).

See also:

Items — Wikibase Data Model The data model of Wikibase describes the structure of the data that is handled in Wikibase.

property = ‘property’

(*EntityType*) Properties are *Entity* objects that describe a relationship between items (or other *Entity* objects) and values of the property. Typical properties are *population* (using numbers as values), *binomial name* (using strings as values), but also *has father* and *author of* (both using items as values).

See also:

Properties — Wikibase Data Model The data model of Wikibase describes the structure of the data that is handled in Wikibase.

wikidata.multilingual — Multilingual texts

class wikidata.multilingual.MonolingualText

Locale-denoted text. It’s almost equivalent to *str* (and indeed subclasses *str*) except that it has two more attribute: *locale* and *locale_code* that denote what language the text is written in.

locale

(*Locale*) The language (locale) that the text is written in.

locale_code = None

(*str*) The code of *locale*.

wikidata.multilingual.normalize_locale_code(*locale*: typing.Union[babel.core.Locale, str]) → str

Determine the normalized locale code string.

```
>>> normalize_locale_code('ko-kr')
'ko_KR'
>>> normalize_locale_code('zh_TW')
'zh_Hant_TW'
>>> normalize_locale_code(Locale.parse('en_US'))
'en_US'
```

CHAPTER 2

Changelog

Version 0.6.1

Released on September 18, 2017.

- Fixed `ImportError` on Python 3.4 due to lack of `typing` module. [[#4](#)]

Version 0.6.0

Released on September 12, 2017.

- Fixed `KeyError` from `Client.get()` on an entity is redirected to its canonical entity.

Version 0.5.4

Released on September 18, 2017.

- Fixed `ImportError` on Python 3.4 due to lack of `typing` module. [[#4](#)]

Version 0.5.3

Released on June 30, 2017.

- Fixed `ValueError` from `Entity.label`/`Entity.description` with languages ISO 639-1 doesn't cover (e.g. cbk-zam). [[#2](#)]

Although this fix prevents these properties from raising `ValueError`, it doesn't completely fix the problem. `babel.core.Locale` type, which Wikidata depends on, currently doesn't support languages other than ISO 639-1. In order to completely fix the problem, we need to patch `Babel` to support them, or make Wikidata independent from `Babel`.

Version 0.5.2

Released on June 28, 2017.

- Fixed `AssertionError` from empty `multilingual_attributes`.

Version 0.5.1

Released on June 28, 2017.

- Fixed `AssertionError` from `len()` or iterating (`iter()`) on `Entity` objects with empty claims.

Version 0.5.0

Released on June 13, 2017.

- Wikidata API calls over network became possible to be cached.
 - `Client` now has `cache_policy` attribute and constructor option. Nothing is cached by default.
 - Added `wikidata.cache` module and `CachePolicy` interface in it. Two built-in implementation of the interface were added:
 - `NullCachePolicy` No-op.
 - `MemoryCachePolicy` LRU cache in memory.
 - `ProxyCachePolicy` Proxy/adapter to another proxy object. Useful for utilizing third-party cache libraries.
 - `wikidata.client.Client.request` logger became to record logs about cache hits as DEBUG level.

Version 0.4.4

Released on June 30, 2017.

- Fixed `ValueError` from `Entity.label`/`Entity.description` with languages ISO 639-1 doesn't cover (e.g. cbk-zam). [[#2](#)]
Although this fix prevents these properties from raising `ValueError`, it doesn't completely fix the problem. `babel.core.Locale` type, which Wikidata depends on, currently doesn't support languages other than ISO 639-1. In order to completely fix the problem, we need to patch `Babel` to support them, or make Wikidata independent from `Babel`.

Version 0.4.3

Released on June 28, 2017.

- Fixed `AssertionError` from empty `multilingual_attributes`.

Version 0.4.2

Released on June 28, 2017.

- Fixed `AssertionError` from `len()` or iterating (`iter()`) on `Entity` objects with empty claims.

Version 0.4.1

Released on April 30, 2017.

- Fixed `AssertionError` from `getlist()` on entities with empty claims.

Version 0.4.0

Released on April 24, 2017.

- Monolingual texts became able to be handled.
 - Added `MonolingualText` type which is a true subtype of `str`.

Version 0.3.0

Released on February 23, 2017.

- Now `Client` became able to customize how it decodes datavalues to Python objects.
 - Added `wikidata.datavalue` module and `Decoder` class inside it.
 - Added `datavalue_decoder` option to `Client`.
- Now files on Wikimedia Commons became able to be handled.
 - New decoder became able to parse Wikimedia Commons files e.g. images.
 - Added `wikidata.commonsmedia` module and `File` class inside it.
- The meaning of `Client` constructor's `base_url` parameter became not to contain the trailing path `wiki/` from `https://www.wikidata.org/wiki/`. As its meaning changed, the value of `WIKIDATA_BASE_URL` constant also changed to not have the trailing path.
- Added `load` option to `Client.get()` method.

Version 0.2.0

Released on February 19, 2017.

- Made `Entity` multidict. Now it satisfies `Mapping[Entity, object]` protocol.
- Added `Entity.type` property and `EntityType` enum class to represent it.
- Added `entity_type_guess` option and `guess_entity_type()` method to `Client` class.
- Implemented `Hashable` protocol and `==/=` operators to `Entity` for equality test.

Version 0.1.0

Initial version. Released on February 15, 2017.
